# Participant Anthropometry Results 

 Date:
## generations

This fact sheet provides your results from today's visit and information about what these measures might mean for your health. These results are not to be used as diagnostic information or make decisions about your health. If you are concerned with these results, you should contact your primary health care physician.

| BODY MEASUREMENTS: |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Height $\quad \ldots \ldots \ldots \mathrm{cm} \quad$ Weight $\quad \ldots \ldots \ldots \mathrm{Kg}$ Waist size $\quad \ldots \ldots \ldots \mathrm{cm}$ |  |  |  |  |  |

## BODY MASS INDEX:

Body mass index (BMI) is a common tool used by researchers and health care professionals. BMI measures your weight in relation to your height, and it is closely associated with measures of body fat.

You can calculate your BMI using this formula:
$\mathrm{BMI}=[$ weight $(\mathrm{kg})$ $\qquad$ / [height (cm) $\left.{ }^{2}\right] \times 10,000$

With the metric system, the formula for BMI is weight in kilograms divided by height in meters squared. Since height is commonly measured in centimeters, an alternate calculation formula, dividing the weight in kilograms by the height in centimeters squared, and then multiplying the result by 10,000 , can be used.

You can also find your BMI using the chart on the reverse side of this page.

## WAIST CIRCUMFERENCE:

Excess weight as measured by BMI is not the only risk to your health. Where excess fat is located on your body may be another risk. If you carry fat mainly around your waist, you are more likely to develop health problems than if you carry fat mainly in your hips and thighs. This is true even if your BMI falls within the normal range. Women with a waist measurement of more than 35 inches may have a higher disease risk than people with smaller waist measurements because of where their fat lies.

## IF YOUR RESULTS ARE HIGH:

Extra weight can put you at higher risk for type 2 diabetes (high blood sugar), high blood pressure, heart disease and stroke, some types of cancer, sleep apnea (when breathing stops for short periods during sleep), osteoarthritis (wearing away of the joints), gallbladder disease, liver disease, and irregular menstrual periods.

If your BMI is between 25 and 30 and you are otherwise healthy, try to look into healthy ways to improve your eating and physical activity habits.

Talk to your health care provider about losing weight if:

- Your BMI is 30 or above, or
- Your BMI is between 25 and 30 and you have two or more of the health problems listed above or a family history of heart disease or diabetes
- Your waist measures over 35 inches -even if your BMI is less than 25 -and you have two or more of the health problems listed above or a family history of heart disease or diabetes.
